

Small AI Project — Pre-Approval Website-Verification Tool

The project (in one paragraph)

Our staff review purchase-approval applications for a government-funded disability program. Before certain purchases (a community class, a gym membership, a household item, a coaching course, etc.) can be approved, a reviewer has to open the provider's **public website** and confirm the thing is real and open to the public at a published price — then save **date-stamped screenshot/PDF evidence** for audits. Today that's done by hand, one site at a time. We want an **AI tool that does that research and evidence-gathering** from a completed application form.

The output we want to see

Given a **completed application form** (PDF/scan), the tool should:

1. **Read the form** and pull out the request — the category, the item/class/membership, the provider's website/link, and the fee stated.
2. **Visit the website** and verify the publicly-checkable facts (is it open to the public? are fees published? does the published price match the form?).
3. **Capture date-stamped evidence** — a **whole-page** screenshot or PDF of the site, **plus** a labeled screenshot for each fact confirmed.
4. **Produce a clear report** — a header, a checklist table (Found / Not Found / Needs Review), and the evidence — that a reviewer can save and share.

The tool **assists** the reviewer; a **human always makes the final approve/deny decision**. Honest "couldn't verify this" results are correct and expected.

A separate **detailed brief** and **ten completed sample application forms** (fictional participants, real public URLs) are provided for the full requirements and test data. A basic working version that demonstrates the workflow on **at least three** samples is enough. How you present the output report is up to you.

What each candidate delivers

1. **The finished product** — a working tool that runs the workflow above.
2. **A Git repo** of their work.
3. **A short video** walking through their approach and which tools/models they used.

(See "Pre-Approval Tool — Project Brief" and "...— Sample Applications" for the full spec, per-category checklists, evidence/report requirements, and test data.)
